

Security Incident Reporting

IT · classification: Internal

Security Incident Reporting (IT)

===== Report suspected incidents - phishing, malware, unusual device behaviour, data exposure - to the security desk within one hour of noticing. Preserve evidence: do not delete messages, do not power off infected machines, disconnect from the network instead. Every report is triaged, logged in the incident register and closed with a postmortem for high severity. Good-faith reporting is never penalised, including self-reported mistakes.
