

Deployment Runbook 2026

Engineering · classification: Internal

Deployment Runbook 2026 (Tech)

===== Deploys ship through the pipeline: build, test, staging soak, canary, then progressive rollout with automated rollback on error-budget burn. Feature flags decouple deploy from release. The on-call engineer announces the window, watches dashboards and holds the rollback authority. Direct production changes are prohibited; break-glass access requires two-person approval and a postmortem within 48 hours. This 2026 revision supersedes the earlier runbook with the canary and burn-alert gates.
